5. VPS (Community Datacenters)

This book discusses how to setup a "home lab" while it not really being at home. Namely, host your server inside a community datacenter ;) or you obtain a virtual machine inside a community datacenter. As of today there does not exist a Deternet community datacenter yet. At this moment all datacenters are owned by for profit entities. However, we are working hard in creating small datacenters at locations where people allows us to install racks. Keep your eyes focused on our blog where we post progress of community dataceners.
