

2. Dashboards

Dashboards are what they say on the tin a dashboard to overview all your self hosted applications. In general you will use a web browser and their default homepage or a homepage that you have set your self like a search engine. Now, wouldn't it be great to have a homepage that are links to all your self hosted or non self hosted apps. It is basically a self hosted bookmark/homepage that you control and own. It is especially handy for apps that are not publicly accessible but only by local IP address. Then instead of remembering the IP address and port numbers you just click a button and voila ;)
